## Lagrange Error Bound Worksheet

1. Let f be a function that has derivatives of all orders on the interval (-1, 1). Assume f(0) = 1,

$$f'(0) = \frac{1}{2}, f''(0) = -\frac{1}{4}, f'''(0) = \frac{3}{8}, \text{ and } |f^{(4)}(x)| \le 6 \text{ for all } x \text{ in the interval } (0, 1).$$

(a) Find the third-degree Taylor polynomial about x = 0 for the function f.

- (b) Use your answer to part (a) to estimate the value of f(0.5).
- (c) What is the maximum possible error for the approximation made in part (b)?
- 2. Let f be the function defined by  $f(x) = \sqrt{x}$ .
  - (a) Find the second-degree Taylor polynomial about x = 4 for the function f.
  - (b) Use your answer to part (a) to estimate the value of f(4.2).
  - (c) Find a bound on the error for the approximation in part (b).
- 3. (Calc) Let f be a function that has derivatives of all orders. Assume f(3) = 1,  $f'(3) = \frac{1}{2}$ ,  $f''(3) = -\frac{1}{4}$ ,  $f'''(3) = \frac{3}{8}$ , and the graph of  $f^{(4)}(x)$  on [3, 4]is shown on the right. The graph of  $f^{(4)}(x)$  is increasing on [3, 4]. (a) Find the third-degree Taylor polynomial about x = 3 for the function f. (b) Use your answer to part (a) to estimate the value of f(3.7). (c) Use information from the graph of  $y = f^{(4)}(x)$  to show that |f(3.7) - P(3.7)| < 0.08. (c) Use information from the graph of  $y = f^{(4)}(x)$  to show that |f(3.7) - P(3.7)| < 0.08. (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information from the graph of  $y = f^{(4)}(x)$  to show (c) Use information fro
  - (d) Could f(3.7) equal 1.283? Show why or why not.
- 4. Estimate the error that results when sin x is replaced by  $x \frac{1}{6}x^3$  for |x| < 0.2. Show your reasoning.
- 5. Use series to find an estimate for  $\int_0^1 e^{-x^2} dx$  that is accurate to three decimal places. Justify your answer.

- 6. Suppose a function f is approximated with a fourth-degree Taylor polynomial about x = 1. If the maximum value of the fifth derivative between x = 1 and x = 3 is 0.01, that is,  $|f^{(5)}(x)| < 0.01$ , then the maximum error incurred using this approximation to compute f(3) is (A) 0.054 (B) 0.0054 (C) 0.26667 (D) 0.02667 (E) 0.00267
- 7. The maximum error incurred by approximating the sum of the series  $1 \frac{1}{2!} + \frac{2}{3!} \frac{3}{4!} + \frac{4}{5!} \dots$ by the sum of the first six terms is (A) 0.001190 (B) 0.006944 (C) 0.33333 (D) 0.125000 (E) None of these

8. The Taylor series about x = 5 for a certain function f converges to f(x) for all x in the interval of convergence. The nth derivative of f at x = 5 is given by

 $f^{(n)}(5) = \frac{(-1)^n n!}{2^n (n+2)}$  and  $f(5) = \frac{1}{2}$ . Show that the sixth-degree Taylor polynomial for f

about x = 5 approximates f(6) with an error less than  $\frac{1}{1000}$ .

## Answers to Worksheet on Series and Error

1. (a) 
$$1 + \frac{1}{2}x - \frac{1}{8}x^2 + \frac{1}{16}x^3$$
  
(b)  $\frac{157}{128} = 1.22656$   
(c) The error is at most  $\frac{1}{64} = 0.015625$   
2. (a)  $2 + \frac{x-4}{4} - \frac{(x-4)^2}{64}$   
(b) 2.049375

(c) The maximum value of the third derivative  $f'''(x) = \frac{3}{8x^{5/2}}$  on [4, 4.2] occurs at x = 4 and

is 
$$\frac{3}{256}$$
. Then  $|R_2(x)| \le \frac{3}{256}(0.2)^3 = 1.5625 \times 10^{-5}$   
3. (a)  $1 + \frac{x-3}{2} - \frac{(x-3)^2}{4 \cdot 2!} + \frac{3(x-3)^2}{8 \cdot 3!}$   
(b) 1.310  
(c) Since  $f^{(4)}(x)$  is increasing on [3, 4],  $f^{(4)}(x) < 6$  on [3, 3.7] so  
 $|\text{Error}| < \left| \frac{6(3.7-3)^4}{4!} \right| = 0.060 < 0.08.$   
(d) Yes,  $1.250 \le f(3.7) \le 1.370$  so  $f(3.7)$  could equal 1.283.

4. (a) By the Lagrange Error Bound, since the derivatives of sin *x* are

 $\cos x$ ,  $-\sin x$ , and  $-\cos x$ , and  $|\cos x| \le 1$  and  $|\sin x| \le 1$ , then

$$|R_3(x)| \le \frac{(0.2)^4}{4!} = 0.000067.$$

5. Because this is an alternating series whose terms decrease in value, we can truncate after 6 terms and have an error correct to three decimal places.

$$\int_{0}^{1} e^{-x^{2}} dx \approx 1 - \frac{1}{3} + \frac{1}{5(2!)} - \frac{1}{7(3!)} + \frac{1}{9(4!)} - \frac{1}{11(5!)} = 0.746729$$

6. E 7. A

8.  $f(6) = \frac{1}{2} - \frac{1}{6} + \frac{1}{16} - \frac{1}{40} + \frac{1}{96} - \frac{1}{224} + \frac{1}{512} - \frac{1}{1152} + \dots$ 

This is an alternating series whose terms are decreasing in size so the error involved in approximating f(6) with the sixth-degree Taylor polynomial is less in magnitude than the seventh-degree term.

 $|\text{Error}| < \frac{1}{1152} < \frac{1}{1000}$  by the Alternating Series Remainder
